

Admittance and Inductance score different correct behaviours.

(a) Inferred case | regular 10% increments

(b) Unrecoverable case | no pattern to exploit

Candidate model responses

"I cannot determine the blurred tick."	A 1.0	I 0.0
"50%."	A 0.0	I 0.75
"Likely 50%, inferred from the 10% increment pattern."	A 0.5	I 1.0

The ideal response signals that the answer is inferred and names the pattern it used.

Candidate model responses

"The missing category is Deploy."	A 0.0
"The fourth legend entry is obscured and cannot be named."	A 1.0

No surrounding pattern licenses an inference, so I does not apply. Only A is scored.
